

Project Mini-Report

November 11, 2022

What was done this week?

- A huge leap forward was done in calculating the placement of solar panels.
- Issues with converting Figma design to Python code - that is why tkinter now will be used for this.

What issues/risks/blockers do you have?

- Teams working separately - a risk that at the end there will be big issues with making the whole system work as a one unit.

What is the goal for the next week?

- Create a implementation, working plan for the whole group.
- Progress even further with the code.
- Try to connect different parts of our system into one.
